

Specification: Unified Data Format

1 Objective

Combine evaluations from all judges into a single unified CSV file for statistical analysis.

2 Final Dataset Format

Column	Type	Description	Example
custom_id	string	Original identifier	gpt-4o-mini_Culture_5_prob42
Novelty	float	1-5	4.0
Usefulness	float	1-5	5.0
Flexibility	float	1-5	3.0
Elaboration	float	1-5	4.0
Cultural Sensitivity	float	1-5	5.0
provider	string	Model used	openai
condition	string	Persona or baseline	Culture_5
problem_id	integer	0-99	42
judge	string	Judge model used	gpt-4o

3 Metadata Extraction from custom_id

The custom_id contains all needed metadata. Parse as:

Field	Extraction Pattern	Example
model	First part before _	gpt-4o-mini
condition	Look for Culture_5, Culture_Expert, Culture_11, Small_Baseline, Large_Baseline	Culture_5
problem_id	After prob	42

4 Required Rows

For a complete experiment (like the one in this paper):

- 7 models $\times$ 5 conditions $\times$ 100 problems = **3,500 responses**
- Each response evaluated by 3 judges $\times$ 3 prompt variations = **9 evaluations**
- Total rows: **31,500**

5 Validation Checks

Before running statistical analysis, verify:

No missing scores (all 5 dimensions present)

All scores between 1 and 5 inclusive

All 100 `problem_ids` present per condition

All 5 conditions present per model

No duplicate `custom_id` entries

6 Notes for Users

- If you use fewer models or judges, adjust expectations accordingly
- The statistical analysis script (`stats.py`) expects this exact format
- Save this file as `data/unified_evaluations.csv`
